

EL ORACLE

User Guide — Mentalism Performance Tool

1. What is Oracle?

Oracle turns your phone into a mentalism tool. You create prediction presets before the show, then secretly input the spectator's choices during performance. The app generates text (or saves an image) that matches their choices perfectly.

The 4 Steps

1. CREATE — Build a preset with narrative templates for every possible outcome
2. PERFORM — Do your routine, the spectator makes choices freely
3. INPUT — Secretly enter their choices using stealth input (black screen)
4. REVEAL — Show the "prediction" that perfectly matches what happened

EXAMPLE Example: spectator picks Right, Left, Right across 3 rounds. You open Notes and they read: "You will go Right, then Left, then Right again. I knew it."

2. Preset Types

Choices

Predict the spectator's choices across 1-5 rounds with 2-6 options. Write a narrative template for each Hit/Miss pattern.

EXAMPLE "Which Hand?" — Right or Left, 3 rounds.

Template for HMM: "You'll go {choixS1}, then {choixS2}, then {choixS3}. I'll guess the first and last, but let you win round 2 ;)"

Duel

Rock/Paper/Scissors prediction. Fixed Rounds (1-5) or First To (2-5 points). S vs P or S vs S.

EXAMPLE 3 rounds, score 2-1 for you:

"We'll finish 2-1 for me. I'll win when you play {looseChoiceS1} and {looseChoiceS2}. I'll let you win one to keep it exciting ;)"

Free Will

3 objects on the table. The spectator takes one, gives one to you, leaves one. 6 possible outcomes. Each outcome has its own pre-written text — no variables needed, the text is complete as-is.

EXAMPLE Objects: Key, Box, Coin.

If spectator takes Key, gives Box, leaves Coin:

"You'll keep the Key — the one that opens everything. You'll give me the Box — because you trust me. The Coin stays — some choices speak for themselves."

Multiple Out

Write 2+ prediction texts. Secretly select the one matching the spectator's choice.

EXAMPLE Astrological sign prediction — one text per sign:

- Aries: "You're a fire sign. Bold, impulsive, always first."
 - Taurus: "Earth grounds you. Patient, loyal, unstoppable."
 - Gemini: "Two minds, one soul. You adapt to everything."
- ...12 texts total, one for each sign.

Confabulation

Multi-slot text template. Each slot has options (Color: red/blue, Animal: cat/dog). Supports API variables.

EXAMPLE Template: "You're thinking of a {{Color}} {{Animal}}"

Slots: Color (red, blue, green) + Animal (cat, dog, bird)

Result: "You're thinking of a blue cat"

Number

- Rainman — formula (e.g., 12345 - XXXX or $XX * XX + X$)
- Birthday — birth date → day of the week + days since
- Today — date complement

Number presets have two output screens (chosen in the preset): Notes (same reveal as above) or Calculator (displays the result as if typed on the iOS Calculator). See Output Modes for setup of the Calculator screenshot.

3. Input Methods

All methods work on a black screen — the spectator sees nothing.

Volume Buttons

Gesture	Option
UP ×1	1
DOWN ×1	2
UP ×2	3
DOWN ×2	4
UP ×3	5
DOWN ×3	6

Undo: 3 rapid presses same direction. Reset: double undo. Max 6 options.

Tap Zones

Black screen divided into invisible zones. Max 6 options.

Options	Layout
2	Top / Bottom (or Left / Right)
3	3 horizontal bands
4	4 corners (or 4 stripes)
5	2×3 grid (1 disabled)
6	2×3 grid

Swipe

Configurable swipe patterns. Each option = a gesture sequence (e.g., ↑→). Fully customizable in the builder. 1 gesture for ≤4 options, 2 for ≤16, 4 for more.

Audio AI

Speech recognition listens to the conversation. Analyzes context with GPT-4o for maximum accuracy. Optional start/stop trigger sentences. Requires OpenAI API key.

Assistant

Remote input via webapp at oass.app/{your-id}. An assistant on another device sees buttons and taps the choice. Your phone stays on black screen.

INFO All stealth screens: long press to exit.

4. Creating a Preset

Step-by-step:

1. Tap "Add Preset" on the home screen
2. Choose the type (Choices, Duel, Free Will, etc.)
3. Name your preset
4. Configure options and labels
5. Write narrative templates for each outcome
6. Choose stealth input method
7. Choose output mode (Notes / Image / Both)
8. Save

INFO Use Test Mode (Settings > General) to practice input without performing. All mappings are shown on screen.

Generate Texts via AI Prompt (IA Import)

Instead of writing every template by hand, tap the "IA Import" button at the top of any bank editor (Choices, Duel, Free Will). The modal guides you in 3 steps:

1. PREPARE — review context (rounds, labels, performer sequence) and tune language/tense/style/number of lines + example texts.
2. PROMPT — the app builds a ready-to-paste prompt listing every outcome and the expected JSON shape. Tap Copy → paste into ChatGPT/Claude.
3. IMPORT — paste the JSON back into the modal. Validation highlights missing entries and unresolved variables. Tap Import to fill the whole bank in one go.

INFO The import modal is available for Choices (by H/M pattern), Duel (by score), and Free Will (6 permutations). Each entry generated by the AI is placed in the correct bucket automatically.

EXAMPLE Choices, 3 rounds, labels "Right/Left":

→ Prompt asks for 8 texts (HHH, HHM, HMH, HMM, MHH, MHM, MMH, MMM), each using {choixS1}..{choixS3} and {hitsCount}.

→ Paste result, tap Import, done.

5. Performance Flow

Before the Show

- ✓ Preset created and tested
- ✓ Test Mode OFF
- ✓ Auto-Copy ON + Shortcut configured
- ✓ Battery charged
- ✓ Do Not Disturb enabled

During the Show

1. Play the preset from home screen
2. Optional: fake pre-screen (Notes or Homescreen)
3. Volume Down or double-tap → black stealth screen
4. Input the choices secretly
5. Text auto-generated, copied, shortcut launches
6. Show the "prediction"

Emergency Gestures

Gesture	Action
3 rapid same direction	Undo
Double undo	Reset
Long press	Exit

6. Routines

A routine chains multiple presets into one flow. After each input, the app automatically moves to the next preset.

Input Order ≠ Output Order

EXAMPLE Input order: Color → Number → Card (easy to collect)

Output order: Card → Color → Number (dramatic build)

You collect info in show order, but the prediction text is assembled in revelation order.

Subtle pixel indicators show chain progress on stealth screens. The webapp shows a progress bar for assistant mode.

7. Output Modes

Notes

Text displayed in a fake Notes screen with configurable background screenshot and fake timestamp. Auto-copied to clipboard. Optional iOS Shortcut launches after (e.g., pastes into real Notes app).

Setting up the Notes screenshot

The Notes reveal overlays your generated text on top of a screenshot of your real Notes app. You control the look.

1. Open your real Notes app and take an empty-note screenshot (with title bar, date, keyboard hidden).
2. Go to Settings → Reveal Background → NOTE SCREEN.
3. Tap Light Mode and upload the screenshot. Repeat for Dark Mode if needed.
4. Tap Calibrate Light/Dark — drag the text overlay to where the note body is in your screenshot. Adjust font size/color.
5. Optional: LIST SCREEN background = a screenshot of the Notes folder list (shown briefly before the note opens for added realism).

INFO Use your own device for the screenshot — the status bar, battery, and time will match. Light + Dark mode choice follows Settings → Reveal Theme.

Image

A pre-uploaded image (one per possible outcome) is saved to your photo gallery. Two options after save:

- Black Screen — stealth, small green pixel confirms save
- Open Photos — the Photos app opens to show the image

You can backdate the image timestamp (e.g., 60 min = "taken 1 hour ago").

Both

Image saved to gallery first → text copied to clipboard → shortcut launches. The performer has both: Notes (text) and Gallery (image) ready.

Calculator Output (Number presets)

Number presets can reveal the result on a fake Calculator screen. It looks like you typed the number on the real iOS Calculator.

Setup (one-time):

1. Open the real iOS Calculator and screenshot an empty state (shows "0").
2. Settings → Reveal Background → CALCULATOR SCREEN → upload the screenshot.
3. Tap Edit Screenshot → erase the "0" with the provided eraser tool so the display is blank — the generated number will be rendered on top.
4. In your Number preset, choose "Calculator" as output (instead of Notes).

INFO The eraser editor also lets you calibrate position and font of the number overlay. The result aligns exactly with the real calculator digit zone.

8. Narrative Variables

Use placeholders in your templates. They're replaced with actual values during the show.

Choices

Variable	Description
{choixS1}, {choixS2}...	Spectator choice per round
{choixP1}, {choixP2}...	Performer choice per round
{hitsCount}, {missCount}	Hit/miss totals
{spectatorSequence}	Full sequence

Duel (First To)

Variable	Description
{nbRounds}	Total rounds played
{nbTies}	Number of ties
{spectatorSequence}	Full sequence

INFO Free Will and Multiple Out don't use variables — each outcome has its own complete text.

9. APIs & AI

Confabulation presets can fetch live data from external APIs.

Inject

Fetches a value from 11z.co — e.g., a word chosen on another platform. Marker: ((INJECT))

Elips

Fetches music data (artist, song, word) from pag.gg. Markers: ((ELIPS_ARTIST)), ((ELIPS_SONG)), ((ELIPS_WORD))

HighScore

Fetches game score from SkyHop. Markers: ((HIGHSCORE_SCORE)), ((HIGHSCORE_RANKING))

AI Transform

Transform any value with a custom GPT-4o-mini prompt. Example: transform a city into a poetic description.

Acrostic

Generate a word column where the Nth letter of each word spells a secret word. Configure word banks per language in Settings.

EXAMPLE Secret word: PARIS (position 3)

rePas

brAve

fuRie

mals

buS

The 3rd letter of each word spells P-A-R-I-S.

10. Import / Export

Export

"E" button = export all presets. Export icon on a card = single preset. JSON copied to clipboard.

Import

"I" button → paste JSON. Accepts: single object, array, or two objects pasted together. New IDs auto-generated.

11. Settings

General

Language, stealth options (test mode, visual feedback), haptic feedback, pre-screen, Bluetooth remote, fake timestamp.

Integrations

Assistant ID + webapp URL, OpenAI API key, external APIs (Inject, Elips, HighScore), Free Text settings, Acrostic word bank.

Display

Auto-copy + shortcut, iCloud sync, data management.

Reveal Background

Upload screenshots used by Notes and Calculator output modes.

- NOTE SCREEN — Light/Dark backgrounds + Calibrate to position the text overlay
- LIST SCREEN (optional) — folder list shown briefly before the note opens
- CALCULATOR SCREEN — screenshot + Edit Screenshot (erase the "0", calibrate number position)

12. FAQ

"Audio doesn't detect anything"

→ Check microphone permissions, audio language setting, and that the OpenAI API key is set for AI mode.

"Shortcut doesn't launch"

→ Check the exact shortcut name in Settings > Display. It must match your iOS Shortcuts app exactly (case-sensitive).

"Assistant doesn't receive"

→ Check the assistant ID matches in Settings and the webapp URL. Both devices need internet. Try refreshing the webapp.

"How to practice safely?"

→ Enable Test Mode in Settings > General. All stealth screens show mappings and feedback. Switch it OFF before performing.
